Re-Time Adjacent Traffic Signals

The modification of the traffic signal timing schemes at one or both of the nearby signalized intersections to create longer gaps in the traffic stream for turning maneuvers at the nearby unsignalized intersection.

**Targeted Crash Types**
- Right-angle
- Rear-end (major road)
- Pedestrian

**Problems Addressed**
- Misjudgment of gaps
- Poor operational performance

**Conditions Addressed**
- Crash history or observed conflicts (right-angle) due to insufficient gaps in through traffic on major road.
- Long queues on minor road due to insufficient gaps in traffic on major road.

**Considerations**
- Changing the signal timing to benefit the adjacent unsignalized intersection may negatively impact the level of service and/or progression on the major road. Impacts should be considered not only for adjacent signals but the signalized corridor as a whole.
- May need to consult with other agencies (state, county, or local) to coordinate signal timing.
