Provide Offset to a Right-Turn Lane

Separation of the right-turn lane from adjacent through lane via a parallel or tapered offset to improve the sight distance for drivers stopped at the minor road approach.

Targeted Crash Types
- Right-angle
- Rear-end (major road)

Problems Addressed
- Inadequate intersection sight distance
- Excessive intersection conflicts

Conditions Addressed
- Poor sight distance of oncoming traffic from minor road approach due to presence of right-turning vehicles.
- History of crashes involving minor road drivers whose vantage was blocked by right-turning vehicles on the major road.

Considerations
- The width of the intersection may increase with the addition of the offset, resulting in a longer crossing distance for pedestrians.
- Ensure that the sight triangle remains clear. The lane should be moved far enough to the right so as not to obstruct the view of oncoming traffic for the minor road driver.
- Through lane widths may be narrowed to provide accommodate right-turn offset.
- Should not be needed where on-street bike lanes exist.
